                                                                                                                                                                                                                                                                                                                                                                      Comment: Calcium binds to the gamma-carboxyglutamic acid (Gla) residues and, with strd
Comment: The gamma-carboxyglutamic acid residues arise by a posttranslational, vitamin
                                                                                                                                                        Comment: Factor Xa converts prothrombin to thrombin during blood clotting. Comment: The two chains are formed from a single-chain precursor by the excision of to Comment: The activation peptide is cleaved by factor IXa (in the intrinsic pathway),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Description: catalyzes the proteolytic activation of prothrombin to thrombin in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   313

 trypsinogen, and Hypoderma lineatum collagenase. The gene encoding human
             Zsig13 is located on chromosome 11q22.1. Zsig13 is useful in industrial processes to degrade unwanted proteins or alter the characteristics of protein-containing compositions. It may also be used in industrial applications in which protease are utilised, including food processing, brewing and alcohol production, and as a component of a laundry detergent. The present sequence represents a human Zsig13 variant
                                                                                                                                                                                                                                1 MAGIPGLLFLLFFLLCAVGQVSPYSAPWKPTWPAYRLPVVLPQSTLNLAKPDFGAEAKLE

                                                                                                                                                                                                The invention relates to human Zsigl3 proteins (AAB48972-B48974), and to DNA encoding them (AAC91782-C91784). The invention also relates to expression vectors and host cells comprising a human Zsigl3 DNA, and the recombinant production of a human Zsigl3 protein or its procusor. Zsigl3 is a serine protease, and has significant homology to Bacillus licheniformis glutamyl endopeptidase, human clotting factor X, human elastase, rat mast cell protease, Streptomyces griseus trypsin, bovine trypsinogen, and Hypoderma lineatum collagenase. The gene encoding human Zsigl3 is located on chromosome 11922.1. Zsigl3 is useful in industrial processes to degrade unwanted proteins or alter the characteristics of protein-containing compositions. It may also be used in industrial applications in which proteases are utilised, including food processing, brewing and alcohol production, and as a component of a laundry detergent. The present sequence represents a human Zsigl3 variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               180

This invention describes novel human transmembrane containing proteins and their encoding nucleic acids. Although no specific use is given for the proteins, they may have a range of activities selected from nutritional uses, cytokine and cell differentiation, immune stimulation/suppression, haematopoiesis regulatory, tissue growth, activithibin, chemostatic/chemokinetic, haemostatic/thrombolytic, receptor/ligand, tumour inhibilory anti-inflammatory and other undefined activities. The cDNAs can be utilized as probes for gene diagnosis and as gene sources for gene therapy. The cDNAs can also be used for large scale expression of proteins. The transformed cells can be used for detection of the corresponding ligands and for screening of novel low-molecular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel human transmembrane containing proteins and their encoding nucleic acids. Although no specific use is given for the proteins, they may have a range of activities selected from nutritional uses, cytokine and cell differentiation, immune stimulation/suppression, haematopolesis regulatory, tissue growth, receptor/ligand, tumour inhibitor, anti-inflammatory and other undefined activities. The cDNAs can be utilized as probes for gene diagnosis and as gene sources for gene therapy. The cDNAs can also be used for large scale expression of proteins. The transformed cells can be used for detection of the corresponding ligands and for screening of novel low-molecular pharmaceuticals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120

ANY13344-403 represent secreted and transmembrane human proteins. The CDNA sequences are obtained from CDNA libraries, prepared from fetal Lung, fetal brain, fetal liver and fetal retina. The encoded polypeptides have specific uses based on their homology to known concoded polypeptides e.g. PRO211 and PRO217 can be used for disorders associated polypeptides e.g. PRO211 and PRO217 can be used for disorders associated vith the preservation and maintenance of gastrointestinal mucosa and the crospal retrone, gastrointestinal ulceration and congenital microyllus atrophy), skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis, epithelial cancers such as lung squamous and devolopment, diseases allowed of the vulva and gllomas), potent effects on cell growth and gllomas), potent effects on cell scort and development, diseases, Alzineimer's disease, Alzineimer's disease, Alzineimer's disease, Alzineimer's disease, Alzineimer's candevelopment of used as for fibromodulin, e.g. for reducing dermal scarring, PRO26 can be used as a target for anti-tumor drugs. PRO263 can be used as an anti-thrombotic agent; PRO287 polypeptides and portions may be used as an anti-thrombotic agent; PRO287 polypeptides and portions may be used for treating problems of the kidney, userus, endometrium, can be used for treating problems of the kidney, userus, endometrium, blood vessels, or related tissue, e.g. in the heart of genital tract
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          240

This invention describes novel human and murine nucleic acids encoding TANGO polypeptides (which are either wholly secreted or transmembrane proteins) which can be used for gene therapy and/or vaccination. The proteins which can be used for gene therapy and/or vaccination. The caids may be used to produce TANGO 180 to TANGO 189 and TANGO 215. The nucleic acids may be used to produce TANGO 180 to TANGO 189 and TANGO 215 to collapse to collapse the produce TANGO 180 to TANGO 189 and TANGO 215 to collapse to detect and quantify the presence of TANGO nucleic acids in a sample and therefore identify or diagnose diseases associated to with inappropriate TANGO expression (e.g. diseases related to over or under expression of the polypeptides or the expression of inactive polypeptides). The nucleic acids and the polypeptides they encode may be used according to standard gene therapy protocols, to treat diseases associated with inappropriate TANGO expression by supplementing a patients own production of the polypeptide of to rectify mutations that can may result in expression of an abnormally active polypeptide. The polypeptides may also be used to identify and produce agonists and antiadonists of TANGO expression and activity which may be used to modulate TANGO expression and diseases. The polypeptides are

particularly useful for use as antigens for producing antibodies to TANGO proteins which may be used for inhibiting the activity of TANGO proteins. They may also be used to detect and quantify the presence of TANGO proteins in samples and therefore identify patients in whom the protein is over- or under-expressed. This sequence represents the human TANGO 186 protein described in the method of the invention
                                                                                                                                                                                                                                                                                120

human signal peptide-containing proteins HSPP-1 to HSPP-14. HSPPs have anticancer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, cardiovascular and antiasthmatic activities, and can be used in gene therapy. HSPPs can be used to treat or prevent disorders associated with decreased activity or function of HSPP. Antagonists of associated with decreased activity or function of HSPP. Antagonists of activity or function of HSPP. Such diseases include cell proliferation (including cancer), inflammation, cardiovascular, neurological, creproductive or developmental disorders, (e.g. arteriosclerosis, cirrhosis, psoriasis, acquired immune deficiency syndrome, anaemia, asthma, Crohn's disease, microbial or other infections, congestive or ischaemic heart disease, alcrobial or other infections, congestive or ischaemic heart disease, Alzheimer's, Parkinson's or Huntington's cirrhosis and monitoring, in gene therapy, as antisense, tripher-forming cor ribozyme therapeutics, for detecting related sequences or genetic variations, and for chromosomal mapping. HSPP are also used to raise specific antibodies (Ab) and to screen for agonists and antagonists or related diseases (in usual immunoassays), as therapeutic antagonists, including screens, and for purification of HSPP from natural

AAYS3622-43 represent bone marrow secreted proteins of human bone marrow stromal cells. The proteins can exhibit cytckine, cell proliferation, or cell differentiation activity (either inducing or inhibiting). They can be used to support colony forming cells or factor-dependent cell lines, to regulate hematopoiesis, and to treat myeloid or lymphoid cell innes, deficiencies. In addition, they may be used to support the growth and proliferation of erythroid progenitor cells, and to treat various anaemias. They can have colony stimulating factor (CSF) activity and can be used to support the growth and proliferation of myeloid cells such as granulocytes, monocytes or macrophages, to prevent or treat myelosuppression, to support the growth and proliferation of megakaryocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and platelets, thereby allowing prevention or treatment of platelet disorders such as thrombocytopenia, to support the growth and proliferation of hematopoeitic stem cells, either in place of or in conjunction with platelet transfusions, to treat stem cell disorders, such as aplastic anaemia and paroxysmal nocturnal hemoglobinuria, or to repopulate the stem cell compartment after irradiation or chemotherapy. They can be used for growth or differentiation of bone, cartilage, tendon, ligament, or nerve issue, as well as for wound healing and tissue repair and replacement, and in the treatment of burns, incisions
                                                                                                                                                                                                                                                                                             Bone marrow secreted protein; bone marrow stromal cell; cytokine; cell proliferation; cell differentiation; hematopoissis; anaemia; myeloid cell deficiency; lymphoid cell deficiency; myeloid cell; erythroid progenitor cell; colony stimulating factor; granulocyte; monocyte; macrophage; myelo-suppression; megakaryocyte; platelet disorder; thrombocytopenia; hematopoeitic stem cell; platelet disorder; aplastic anaemia; bone differentiation; paroxysmal nocturnal hemoglobinuria; bone growth; cartilage; tendon; ligament; nerve; wound healing; tissue repair; burn; incision; ulcer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated human polynucleotide and secreted proteins can induce production of other cytokines in certain cell populations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        bone fracture; cartilage damage; artificial joint.

The present interaction to a secreted protein sequences given in present interaction to the present interaction to the present interaction sequences given in AAA80660-A80623 encode the 12 secreted protein sequences given in AAA82660-A80623. The human secreted proteins have various activities of dependent on the tissues in which they are expressed. Examples of the activities of the proteins include: immunosuppressant; anti-inflammatory; antiarteriosclerotic; antiarteriosclerotic seamples of which include: immune disorders e.g. antagonists and conditions examples of which include: immune disorders e.g. Addison's disease, rheumatory disorders e.g. inflammatory bowel disease, cronnary atteriosclerosis and purpura; cardiovascular disorders e.g. coronary arteriosclerosis and purpura; cardiovascular disorders e.g. coronary arteriosclerosis and myocarditis; cancer e.g. melanoma and lymphoma: The paraprotein and polymucleotide sequences and also as an an also and an application diseases. The human secreted protein gene cc and the treatment of infectious diseases. The human secreted protein gene #10 and protein gene #10 is located on chromosome 12.

Sequences AAB255616-825618 represent genes which are related to the coronary secreted protein gene#10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                       the prevention, amelioration and treatment of autoimmune, lammatory, hyperproliferative and cardiovascular disorders, cancer, ids, and infectious diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120

Moore PA,

nucleotide sequences encoding them. The polynucleotide sequences given in present interiors and the sequences encoding them. The polynucleotide sequences given in AAB25576-B25593. The human secreted proteins activities of the proteins include: immunosuppressant; anti-inflammatory; antiarteriosclerotic; antiarcario, dermatological; antiproliferative; antiarteriosclerotic; antiarcarior, dispersed and proteins, polypeptides, agonists and antiqungal activity. The proteins, polypeptides, agonists and antiquose various disease, disperders and conditions examples of which include: immune disorders e.g. Addison's disease, rheumatoid arthritis, dermatitis, and multiple sclerosis; inflammatory disorders e.g. inflammatory bowel disease,

Crohn's disease and nephritis; hyperproliferative disorders such as paraproteins and purpura, cardiovascular disorders e.g. coronary

The paraproteins and purpura; cardiovascular disorders e.g. coronary

arteriosclerosis and mycarditis; cancer e.g. melanoma and lymphoma. The proteins and polymucleotide sequences may also be used in wound healing and the treatment of infectious diseases. The human secreted protein gene #10 and protein sequences are represented in sequences AA880615 and AA825585. Secreted protein gene #10 is located on chromosome 12. Sequences AAB25516-B2508 esquences and AAA80669-A80676 represent genes which are related to the sequences and AAA80669-A80676 represent genes which are related to the The present invention relates to 12 secreted human proteins and the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human Zsigl3 proteins (AAB48972-B48974), and to DNA encoding them (AAC91782-C91784). The invention also relates to expression vectors and host cells comprising a human Zsigl3 DNA, and the recombinant production of a human Zsigl3 protein or its precursor. Zsigl3 is a serine protease, and has significant homology to Bacillus is a serine protease, and has significant homology to Bacillus clicheniformis glutamyl endopeptidase, human clotting factor X, human elastase, rat mast cell protease, Streptomyces griseus trypsin, bovine trypsinogen, and Hypoderma lineatum collagenase. The gene encoding human grills is located on chromosome 11q22.1. Zsigl3 is useful in industrial processes to degrade unwanted proteins or alter the characteristics of protein-containing compositions. It may also be used in industrial protein-containing compositions in may also be used in industrial betwing and alcohol production, and as a component of a laundry detergent. The present sequence represents a human Zsigl3 variant

                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention.

The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNP) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumors, such as prostate and breast tumors, in mammals and to screen for modulators of the compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               181 KTYVKGTQKLRVGFLKPKFKDGGRGANDSTSAMPEQMKFQWIRVKRTHVPKGMIKGNAND 240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  241 IGMDYDYALLELKKPHKRKFMKIGVSPPAKQLPGGRIHFSGYDNDRPGNLVYRFCDVKDE 300

Sequence 18, Application US/09072384

Patent No. 615342

GENERAL INFORMATION:

APPLICANT: Sheppard, Paul O.

TITLE OF INVENTION: SRINE PROTEASE POLYPEPTIDES

TITLE OF INVENTION: AND MATERIALS AND METHODS FOR MAKING THEM

NUMBER OF SEQUENCES: 18
